

# WelfareABM

A poster-style summary of agent-based welfare policy experiments

Mixed policy reduces asset Gini from 0.626 to 0.460

## Question

Can UBI and targeted transfers balance fairness and fiscal sustainability?

## Main finding

Mixed welfare produces the strongest reduction in asset inequality.

## Model

Government + 3-5 firms + heterogeneous households with lifecycle dynamics.

## Trade-off

The same policy consumes the most fiscal space, but remains sustainable after calibration.

Policy comparison over 20 random seeds. Mixed welfare has the lowest asset Gini.

## Asset-flow balance under mixed welfare policy

Width is proportional to the average monetary flow in the last 20 steps across 20 random seeds.

Asset-flow balance: tax revenue and transfers are nearly closed in the calibrated mixed policy.
